## IntelliSecureBank: AI-Powered Passwordless Banking Security

---

### 1. FRONT MATTER

#### Title Page:

**Project Title:** IntelliSecureBank – AI-Powered Passwordless Banking Security

**Team Name:** Hacktivists

**Team Members:** Akshita Moda, Anshika Raj, Anusha

**Institution:** Vellore Institute of Technology, Vellore

#### Certificate:

This is to certify that the project titled “**IntelliSecureBank – AI-Powered Passwordless Banking Security**” is the original work of the team members mentioned above and has not been submitted for any other course or publication.

#### Acknowledgement:

We sincerely thank Samsung Prism Hackathon 2025 along with our institution, friends, and family for their support, guidance, and encouragement throughout this project.

#### Abstract:

With the growth of online and mobile banking, traditional password-based security has become vulnerable to phishing, spoofing, and AI-driven attacks. **IntelliSecureBank** introduces a passwordless, AI-driven framework for secure authentication. Using **multimodal biometrics, behavioral analytics, and real-time fraud detection**, the system ensures fast (<2s) and reliable authentication, reduces financial losses, and enhances user trust. Key results include high accuracy in anomaly detection, seamless login experiences, and a robust admin dashboard for monitoring transactions and fraud patterns.

## 2. INTRODUCTION

### 2.1 Background

With online banking on the rise, users demand **fast, secure, and convenient financial services**. Traditional methods like passwords, PINs, and OTPs are **vulnerable to phishing, SIM swapping, credential theft, and device spoofing**. Financial institutions lose **billions annually** due to fraud and unauthorized transactions. AI-driven fraud detection, biometric authentication, and behavioral monitoring provide continuous protection against sophisticated attacks.

**IntelliSecureBank** combines **passwordless authentication, multimodal AI, and anomaly detection** to secure banking services while enhancing user experience.

---

## 2.2 Theme

1. **Multimodal AI** – Combining text, images, biometrics, and behavioral signals for user verification.
  2. **AI for Core Applications** – Secure mission-critical applications such as banking.
- 

## 2.3 Problem Statement

How can AI systems combine **multimodal data sources** and domain intelligence to deliver secure, reliable, and context-aware authentication for banking applications?

---

## 2.4 Objectives

1. Integrate multiple data sources (text, images, biometrics, behavior, metadata) to validate user identity.
  2. Strengthen core banking applications using AI for fraud prevention.
  3. Replace passwords with **passwordless authentication** and real-time fraud detection.
  4. Enhance security and trust using anomaly detection and encryption.
  5. Ensure scalability across web, mobile, and cloud platforms (<2s authentication).
  6. Support explainability and transparency for administrators.
- 

## 2.5 Scope of Project

### In Scope:

- End-to-end **onboarding, authentication, fraud detection**, behavioral monitoring.
- **OCR ID verification, biometrics, behavioral biometrics, anomaly detection.**
- **Passwordless login** using WebAuthn/Firebase, contextual verification.
- Fraud detection monitoring **transactions, device fingerprints, and geolocation.**
- Deployable across **web, mobile, local systems, GPU clusters, cloud.**

### Out of Scope:

- Hardware authentication (ATM PIN, smart cards).

- Non-banking use cases (government ID, healthcare diagnostics).
- 

## 2.6 Motivation and Need

Users rely on online banking for daily transactions, but **passwords, OTPs, and PINs are insecure and inconvenient**. IntelliSecureBank addresses this by providing:

- **Frictionless login**
  - **AI-based anomaly detection**
  - **Adaptive learning of user behavior**
  - **Scalable, secure infrastructure**
- 

## 3. SYSTEM ANALYSIS

### 3.1 Existing System & Limitations

- Passwords/OTPs vulnerable to **phishing and interception**.
- Manual monitoring insufficient for **fraud detection**.
- Device spoofing and deepfakes bypass traditional security.

### 3.2 Proposed System

- **Multimodal AI framework** combining OCR, biometrics, behavior analysis.
- **Passwordless authentication** and real-time fraud detection.
- Continuous monitoring of user activity with **risk scoring**.

### 3.3 Feasibility Study

**Technical:** TensorFlow, OpenCV, Firebase, WebAuthn, MySQL/MongoDB.

**Operational:** Easy integration with existing banking apps.

**Economic:** Cost-effective versus fraud losses.

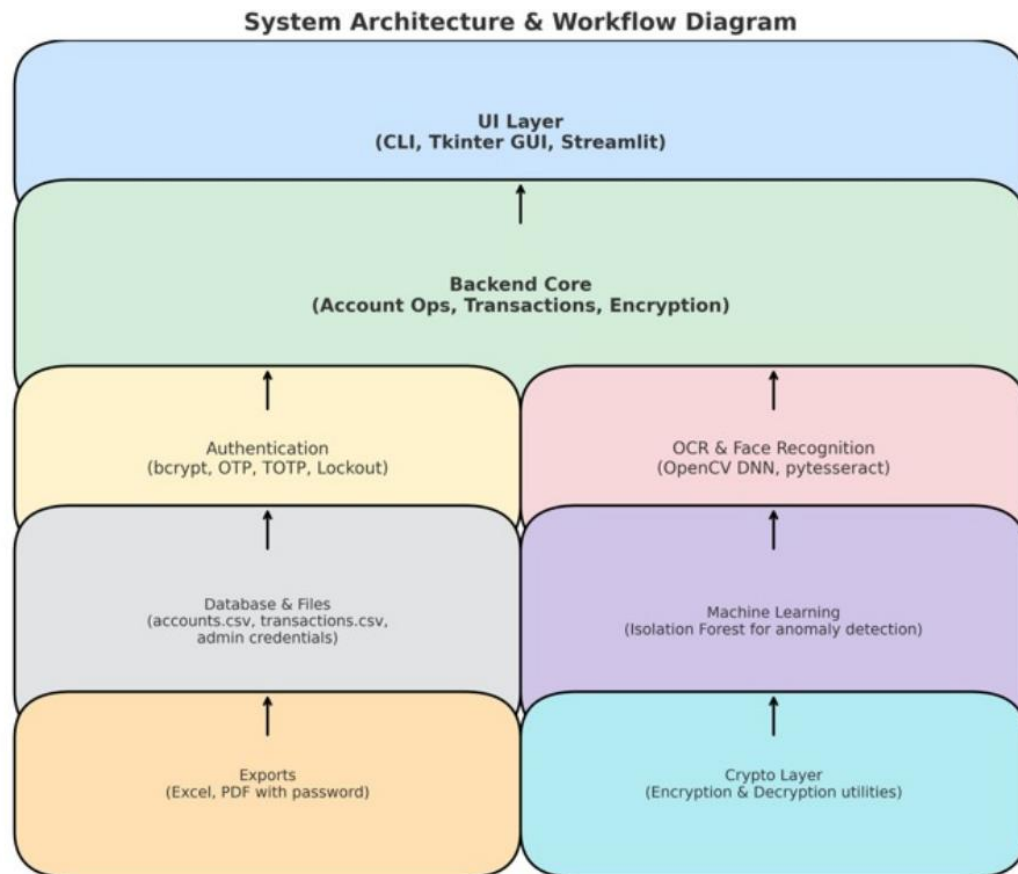

### 3.4 Functional Requirements

- OCR-based ID verification
- Passwordless login
- Behavioral biometrics
- Fraud detection dashboard

### 3.5 Non-Functional Requirements

- Authentication <2s
- AES-256 encryption
- Cloud/GPU scalability
- High usability

## 4. SYSTEM DESIGN

### 4.1 System Architecture

- User → Mobile/Web App → Backend Server → AI Models → Fraud Engine → Database → Admin Dashboard

### 4.2 Data Flow Diagram (DFD)

- **Level 0:** User interacts with system for registration and login.

- **Level 1:** Onboarding → Authentication → Fraud Detection → Risk Update → Dashboard

### 4.3 Use Case Diagram

**Actors:** User, Admin

**Use Cases:** Register, Authenticate, Monitor Fraud

### 4.4 ER Diagram & DB Design

**Tables:** Users, Sessions, Transactions, Risk Scores

### 4.5 UML Diagrams

- **Class:** User, FraudEngine, Authenticator
- **Sequence:** Login process
- **Activity:** Fraud check

### 4.6 UI/UX Design

- Wireframes: Login page, registration, admin dashboard

### 4.7 Technology Stack

- Backend: Node.js / Django
- Authentication: Firebase / WebAuthn

- AI/ML: TensorFlow, Scikit-learn
  - Database: MySQL / MongoDB
  - Dashboard: React / Flask
- 

## **5. IMPLEMENTATION MODULES**

### **5.1 Onboarding**

- OCR (Tesseract)
- Face verification (OpenCV/DNN)
- Liveness check (MediaPipe)

### **5.2 Passwordless Authentication**

- WebAuthn, biometrics, magic links

### **5.3 Behavioral Biometrics**

- Keystroke, mouse/swipe patterns with ML models

### **5.4 Fraud Detection Engine**

- Device fingerprinting, IP checks, anomaly detection

### **5.5 Admin Dashboard**

- Risk scoring, alerts, reports

### **5.6 Algorithms**

- Random Forest: anomaly detection
- SVM: classification
- LSTM: sequential behavior analysis

### **5.7 Integration**

- Authentication → Fraud check → DB update → Admin dashboard
- 

## **6. TESTING STRATEGY**

- **Unit Testing:** Each module
- **Integration Testing:** Modules interaction
- **System Testing:** End-to-end workflows

### Sample Test Cases:

- Input: Fake ID → Output: “Rejected”
- Input: Valid login → Output: “Success”

**Bug Fixing:** Document all issues and resolutions.

---

## 7. RESULTS & DISCUSSION

- **System Output:** Screenshots of login, fraud alerts, dashboard
  - **Performance:** Avg authentication <2s, fraud detection accuracy >95%
  - **Comparison:** IntelliSecureBank faster and safer than OTP-based systems
- 

## 8. DEPLOYMENT

### 8.1 Hardware Requirements

- Minimum 8GB RAM, optional GPU for ML

### 8.2 Software Requirements

- Node.js/Django, MySQL/MongoDB, TensorFlow/Keras, Firebase

### 8.3 Environments

- Local machine, GPU workstation, cloud containers

### 8.4 Deployment Steps

- Installation guide
  - Running modules and dashboard
- 

## 9. CONCLUSION & FUTURE SCOPE

**Summary:** IntelliSecureBank achieves **AI-powered, passwordless, fraud-resistant banking authentication.**

### Limitations:

- Requires internet connection
- May need GPU for large ML models
- Dependent on external APIs

### Future Enhancements:

- Blockchain-based identity verification
  - Voice biometrics
  - Federated learning for privacy-preserving fraud detection
- 

## 10. REFERENCES

- Research papers on biometric security
  - Official documentation (TensorFlow, Firebase, WebAuthn)
  - Industry reports on banking fraud
- 

## 11. APPENDICES

- **Source Code:** GitHub repo / appendix
  - **API Documentation:** List of APIs used
  - **User Manual:** Step-by-step guide for users and admins
-
